As the Name Suggests, the Polar Exchanger is Built for Extreme Frost!

If you crave a constant supply of fresh air and live in harsh mountain conditions where winter temperatures drop far below freezing, you’ve just found the perfect solution! This innovative exchanger stands out with its low energy consumption and seamless operation from -15°C to 45°C. It is ideal for bedrooms, home offices, workplaces, or even senior living facilities.

With this advanced model, you get both an HRV and an ERV heat exchanger in one. Thanks to its patented rotation technology, the Polar exchanger effectively removes excess humidity like an HRV while also functioning as an enthalpy exchanger (ERV), even in demanding winter conditions.

Bring cutting-edge technology into your space and enjoy the comfort and energy-efficient operation of a ventilation unit—without any preheating required.
